Lasso support recovery, standard Gaussian design, $k = \lfloor 0.40\, p^{0.75} \rfloor$ (200 reps per point; bands = 95% Wilson CI)
(a) Against raw sample size n
(b) Against rescaled sample size θ
Probability of exact signed-support recovery
Number of samples n
Rescaled sample size θ = n / [2k log(p − k)]
theory: θ* = 1
p = 128 (k = 16)
p = 256 (k = 26)
p = 512 (k = 44)
